

2005 HCP products available with Anti-bacterial coating

HCP have been able to offer an anti-bacterial coating on all of its products. As part of an existing or developing cleaning procedure the new coating can inhibit the growth of bacteria including the "superbug" MRSA. The AB coating is available on all HCP products and is applied during the manufacturing process.

The ability to control or inhibit the growth of bacteria is a subject matter that has new significance. Easy-clean coatings provide resistance to bacteria; however, coatings with active anti-bacterial properties provide extra protection.

Due to this product development HCP are actively pursuing the opportunities afforded by the PFI and healthcare sectors including Procure 21 programs and are working alongside a number of leading mechanical designers and contractors.
